$^{40}\text{Ar}/^{39}\text{Ar}$ analyses were conducted on 20 groundmass samples from basalt flows and mafic dikes over the course of about 16 years at the New Mexico Geochronology Research Laboratory. All samples were step-heated to provide incremental heating age spectra. A summary of the age results is provided in Table A1 and analytical methods and detailed analytical data are given in Tables A2 and A3, respectively. Age spectra are plotted in Figures A1 and A2. All data are reported relative to Fish Canyon sanidine with an assigned age of 28.201 Ma (Kuiper et al., 2008) and a total ^{40}K decay constant of 5.463e-10 /a (Min et al., 2000).

Age spectra are variable in shape and complexity, however a weighted mean age (plateau age) based on the inverse variance is calculated for 19 of the 20 samples. The number of steps chosen for the plateau segment is based on using consecutive steps that yielded an MSWD value less than 15. This is somewhat arbitrary, but because complexity of the spectra is likely related to a combination of factors such as minor excess argon and/or argon loss coupled with ^{39}Ar recoil artifacts it was deemed prudent to include steps that did not always define a normal distribution. In general higher temperature steps were the most concordant and thus these steps dominate the plateau segments. Sample GM-1 (Figure A1(d)) was unusual with two semi-flat segments that have no unambiguous explanation and thus the integrated age was chosen as the preferred eruption age.

Notes

L# - Lab Identifier

All samples are Groundmass Concentrates

Irrad = Irradiation: NM-141 Texas A&M Reactor, 14 hours; NM-224 = USGS Denver, 5 hours; NM-234 = USGS Denver, 10 hours; NM-256 = USGS Denver, 20 hours;

NM-288 = USGS Denver, 8 hours

n - number of steps on the plateau or total number of steps

na - not applicable

MS - Mass spectrometer: O = Obama, ARGUS VI; M = MAP-215-50; F = Felix, Helix MC-plus

Correction Factors:

$(^{40}\text{Ar}/^{39}\text{Ar})_{\text{K}}$	\pm	$(^{39}\text{Ar}/^{37}\text{Ar})_{\text{ca}}$	\pm	$(^{36}\text{Ar}/^{37}\text{Ar})_{\text{ca}}$	\pm

Table A2. Analytical methods.

Methods

Sample preparation and irradiation:

Groundmass concentrated by coarse crushing and picking fragments visibly free of phenocrysts.
 Samples were loaded into machined Al discs and irradiated in 5 separate batches (Table A1).
 Neutron flux monitor Fish Canyon Tuff sanidine (FC-2). Assigned age = 28.201 Ma; Kuiper et al. (2008).

Instrumentation and analytical parameters:

Mass Analyzer Products 215-50 mass spectrometer on line with automated all-metal extraction system.

NM-141 samples. Step-heated using a Mo double vacuum resistance furnace.

MAP-215-50

Heating duration = 8 minutes

Gas exposed to a GP-50 Getter (450°C) during heating

Gas cleaned in 2nd stage after heating for 7 minutes with two SAES GP-50 getters. One operated at ~450°C and one at 20°C.

Gas also exposed to a W filament operated at ~2000°C while in 2nd stage.

Blank = 120, 0.8, 0.1, 1.9, 0.7 x 10⁻¹⁷ moles for masses 40, 39, 38, 37, 36, respectively.

Sensitivity 1.5 x 10⁻¹⁶ moles/pA.

NM-224 samples. Step-heated using a 50 W CO₂ laser.

MAP-215-50

Heating duration = 60 seconds

Reactive gases removed by a 3 minute exposure to two SAES GP-50 getters. One operated at ~450°C and one at 20°C.

Gas also exposed to a W filament operated at ~2000°C and a cold finger operated at -140°C.

Blank = 185, 1.2, 0.2, 1.8, 0.8 x 10⁻¹⁷ moles for masses 40, 39, 38, 37, 36, respectively.

Sensitivity 5 x 10⁻¹⁷ moles/pA.

NM-234 samples. Step-heated using a 50 W CO₂ laser.

MAP-215-50

Heating duration = 60 seconds

Reactive gases removed by a 4 minute exposure to two SAES GP-50 getters. One operated at ~450°C and one at 20°C.

Gas also exposed to a W filament operated at ~2000°C and a cold finger operated at -140°C.

Blank = 80, 0.7, 0.2, 0.7, 0.5 x 10⁻¹⁷ moles for masses 40, 39, 38, 37, 36, respectively.

Sensitivity 5 x 10⁻¹⁷ moles/pA.

NM-256 samples. Step-heated using a 75 W Diode laser.

ARGUS VI (Obama)

Heating duration = 60 seconds

Multi-collector configuration: 40Ar-H1, 39Ar-Ax, 38Ar-L1, 37Ar-L2, 36Ar-L3

Amplification: H1, L1, L2 1E12 Ohm Faraday, AX 1E13 Ohm Faraday, L3 - CDD ion counter, deadtime 18 nS.

Reactive gases removed by a 8 minute exposure to one SAES GP-50 getter operated~450°C.

Gas also exposed to cold finger operated at -140°C.

Blank = 50, 0.7, 0.4, 0.3, 0.2 x 10⁻¹⁷ moles for masses 40, 39, 38, 37, 36, respectively.

Sensitivity 1 x 10⁻¹⁶ moles/fA.

NM-288 samples. Step-heated using a 75 W Diode laser.

Helix MC-Plus (Felix)

Heating duration = 40 seconds

Multi-collector configuration: 40Ar-H2, 39Ar-H1, 38Ar-Ax, 37Ar-L1, 36Ar-L2

Amplification: H2, H1, Ax, L1, L2 1E12 Ohm Faraday, L3 - CDD ion counter, deadtime 20 nS.

Reactive gases removed by a 1.5 minute exposure to one SAES GP-50 getter operated~450°C.

Gas also exposed to cold finger operated at -140°C.

Blank = 15, 0.3, 0.2, 0.2, 0.06 x 10⁻¹⁷ moles for masses 40, 39, 38, 37, 36, respectively.

Sensitivity 2.5 x 10⁻¹⁶ moles/fA.

J-factors determined to variable precision (Table A3) with typically 6 FC-2 sanidine grains analyzed from at least 4 radial positions around the irradiation tray.

Table A3. 40Ar/39Ar isotopic results for groundmass samples.

Notes:

Isotopic ratios corrected for blank, radioactive decay, and mass discrimination, not corrected for interfering reactions.

Errors quoted for individual analyses include analytical error only, without interfering reaction or J uncertainties.

Integrated age calculated by summing isotopic measurements of all steps.

Integrated age error calculated by quadratically combining errors of isotopic measurements of all steps.

Plateau age is inverse-variance-weighted mean of selected steps.

Plateau age error is inverse-variance-weighted mean error (Taylor, 1982) times root MSWD where MSWD>1.

Plateau error is weighted error of Taylor (1982).

Isotopic abundances after Steiger and Jäger (1977).

Decay constants and isotopic abundances after Steiger and Jäger (1977).

X preceding sample ID denotes analyses excluded from plateau age calculations.

Weight percent K₂O calculated from ³⁹Ar signal, sample weight, and instrument sensitivity.

Ages calculated relative to FC-2 Fish Canyon Tuff sanidine interlaboratory standard at 28.201 Ma (Kuiper et al., 2008).

Decay Constant (LambdaK (total)) = 5.463e-10/a (Min et al., 2000)

D = 1 amu mass discriminatin in favor of light isotopes

IC = Detector intercalibration; Measured 40Ar/36Ar of air standard divided by 295.5
