Oil and gas in Socorro County, New Mexico

Anonymous, 1963, pp. 217-219

in:

Socorro Region, Kuellmer, F. J.; [ed.], New Mexico Geological Society 14th Annual Fall Field Conference Guidebook, 204 p.

This is one of many related papers that were included in the 1963 NMGS Fall Field Conference Guidebook.

Annual NMGS Fall Field Conference Guidebooks

Every fall since 1950, the New Mexico Geological Society (NMGS) has held an annual [Fall Field Conference](#) that explores some region of New Mexico (or surrounding states). Always well attended, these conferences provide a guidebook to participants. Besides detailed road logs, the guidebooks contain many well written, edited, and peer-reviewed geoscience papers. These books have set the national standard for geologic guidebooks and are an essential geologic reference for anyone working in or around New Mexico.

Free Downloads

NMGS has decided to make peer-reviewed papers from our Fall Field Conference guidebooks available for free download. Non-members will have access to guidebook papers two years after publication. Members have access to all papers. This is in keeping with our mission of promoting interest, research, and cooperation regarding geology in New Mexico. However, guidebook sales represent a significant proportion of our operating budget. Therefore, only *research papers* are available for download. *Road logs, mini-papers, maps, stratigraphic charts*, and other selected content are available only in the printed guidebooks.

OIL AND GAS IN SOCORRO COUNTY, NEW MEXICO

ANONYMOUS—III

Prospecting for oil and gas in Socorro County began in 1923 and has continued intermittently to the present. Twenty-four wells have been drilled, but no production has been developed (see figure 1 and table 1). Oil or gas showings were reported in seven wells but have not been verified. With some exceptions, the wells were drilled by poorly financed or inexperienced operators, and some of the wells are not regarded as adequate tests of the area in which they were drilled.

An inspection of available geologic maps and a review of the literature does not indicate a more than moderately hopeful future for Socorro County as an oil- or gas-producing region, especially when compared with the productive areas of southeastern and northwestern New Mexico. There are large areas that are structurally disturbed or covered by volcanic rocks. The Precambrian basement is relatively high and Precambrian rocks are exposed in the mountain areas. Tertiary intrusive rocks of varied composition and form are not uncommon. Rocks of Mississippian age and of the type common in southern New Mexico are not known north of the Magdalena Mountains. Pre-Mississippian strata are apparently present only in a faulted area in the southeastern corner of the county.

Permian and later sedimentary formations offer little inducement for testing. They are mostly of shallow water or continental origin, or of the red-bed type, and are widely exposed by erosion. They are not considered to be of importance as potential sources of oil or gas. Cretaceous strata that underlie the Jornada del Muerto in the eastern part of the county may be an exception by reason of their more favorable lithologic character.

Strata of Pennsylvanian age that comprise the Magdalena Group are regarded as the most likely source of oil or gas in Socorro County. They consist of limestone, sandstone, and shale. The shales near Scholle in the northeastern corner of the county are reported to yield oil on distillation. Most of or all the showings reported in the wells are in Pennsylvanian rocks. The Magdalena Group has a maximum thickness of more than 2000 feet, and in many places has an adequate cover of younger strata. Structure is locally favorable and stratigraphic trap conditions are undoubtedly present. The future of Socorro County as an oil or gas region lies in the hands of the operators who are willing and able to take the risks of drilling in a strictly wildcat region.
