ROAD LOGS
First Day: Road Log from Van Horn to Guadalupe Mountains to the Duval Frasch Sulphur Operation in Culberson County to Seven Heart Gap and Return to Van Horn ................................................................. John M. Hills, W. N. McAnulty, Joe Muzzy, D. E. Cochran and P. W. Dickerson 1
Second Day: Road Log from Van Horn to Tumbledown Mountain, Hazel Mine, Southern Wylie Mountains and Return to Van Horn ......................................................................................... W. N. McAnulty and Jerry M. Hoffer 19
Third Day: Road Log from Van Horn to Allamore to Eagle Mountains to Quitman Mountains .......... W. N. McAnulty and Jerry M. Hoffer 27
Supplemental Road Log No. 1: Quitman Mountains to New Mexico State Line Along 1-10 .......................................................................................................................... William S. Strain 41
Supplemental Road Log No. 2: Van Horn to Toyah, Texas Vial-10 and 1-20 ................................................................. Bruce T. Pearson 43
Supplemental Road Log No. 3: Van Horn to Alpine, Texas F W. Daugherty and P. W. Dickerson 48
Road Log References .................................................................................................................................................. 53

ARTICLES
Scenes from the Past

Scenes from the Past—V11 .............................................................................................................................................. W. L. Hiss 55

Physiography

Physiographic Features, Trans-Pecos Region ............................................................................................................. James R. Underwood, Jr. 57

Structure, Tectonics and Geophysics

Geology of Tumbledown Mountain ........................................................................................................................ Philip B. King 59
Structural Zones Transecting the Southern Rio Grande Rift
  Preliminary Observations ................................................................................................................................. Patricia Wood Dickerson 63
Superposed Deformation in the Santiago and Northern Del Carmen Mountains, Trans-Pecos Texas .................. Robert C. Cobb and Stephen Poth 71
Seismicity in the Basin and Range Province of Texas and Northeastern Chihuahua, Mexico ......................... David B. Dumas 77
Quaternary Faulting in Salt Basin Graben, West Texas ...................................................................................... Lisa K. Goetz 83
Laramide Evaporite Tectonics along the Texas-Northern Chihuahua Border ................................................. John C. Cries 93

Magnetostratigraphy in the Trans-Pecos Volcanic Field:
  Preliminary Results from the Eocene-Oligocene Vieja Group ........................................................................ Margaret M. Testarmata and Wulf A. Gose 101

A Regional Geological and Geophysical Study of the Delaware Basin, New Mexico and West Texas
  Texas Lineament Revisited ............................................................................................................................... William R. Muehlberger 113

Tectonic Style and Deformational Environment in the Eagle-Southern Quitman Mountains, Western Trans-Pecos Texas
  A Preliminary Heat Flow Map of West Texas .................................................................................................... Bruce Taylor and Robert F. Roy 137

Quaternary Fault System in the Tularosa and Hueco Basins,
  Southern New Mexico and West Texas ........................................................................................................... William R. Seager 123

Precambrian Geology

Precambrian Geology of the Van Horn Area, Texas ................................................................................................. Donald M. Davidson, Jr. 151

Pre-Bliss (PC) Rocks in the Van Horn Region, Trans-Pecos Texas ....................................................................... Rodger E. Denison 155
Stratigraphy, Sedimentology and Paleontology

The Yucca Formation—Early Cretaceous Continental and Transitional Environments, Southern Quiltman Mountains, Hudspeth County, Texas ................................................................. Donald H. Campbell 159
Occurrence of Ostrea beloitii Logan in Cenomanian Rocks of Trans-Pecos Texas ................................................................................................................................. W. A. Cobban and S. C. Hook 169
Origin of Castilles on the Gypsum Plain of Texas and New Mexico ................................................................. Douglas W. Kirkland and Robert Evans 173

Land Use in the Basin and Range Topographic Province of Vegetation of Trans-Pecos Texas .................................................................................................................................................... A

The Modern Vertebrate Fauna of the Van Horn Country .................................................................................. Arthur H. Harris 295

Giant Desiccation Polygons in Wildhorse Flat, West Texas .................................................................................. Lisa K. Goetz 285

General Survey of the Oil and Gas Prospects of Trans-Pecos Texas ........................................................................ Bruce T. Pearson 271

Mineralization in the Northern Quitman Mountains, Hudspeth County, Texas .................................................................................................................. David H. Murry 267

Geology and Mineralization of the Sierra Blanca Peaks, Hudspeth County, Texas .................................................. W. N. A

A Note on Geothermal Indicators in Southern Hudspeth and Culberson Counties, Texas ......................................................... Gerald Edwards 247

Uranium Assessment Along the Precambrian Unconformity, Van Horn Area, Texas ................................................................. Donal d M. Davidson, Jr., Gerald Edwards and Philip C. Goodell 251

A Note on Geothermal Indicators in Southern Hudspeth and Culberson Counties, Texas ................................................................. Jerry M. Hoffer 257

Barite Deposits at Seven Heart Gap, Apache Mountains, Culberson County, Texas ................................................................. Noel McAnulty 259

Geology and Mineralization of the Sierra Blanca Peaks, Hudspeth County, Texas ................................................................. W. N. McAnulty 263

Mineralization in the Northern Quiltman Mountains, Hudspeth County, Texas ................................................................. David H. Murry 267

General Survey of the Oil and Gas Prospects of Trans-Pecos Texas ................................................................. Bruce T. Pearson 271

Sulfur Deposits in Ochoa Rocks of the Gypsum Plain, Southeast New Mexico and West Texas ................................................................. Richard Smith 277

Geomorphology and Hydrology

Giant Desiccation Polygons in Wildhorse Flat, West Texas .................................................................................. Lisa K. Goetz 285

Movement of Ground Water in Permian Guadalupian Aquifer Systems, Southeastern New Mexico and Western Texas ................................................................. W. L. Hiss 289

Natural History

The Modern Vertebrate Fauna of the Van Horn Country .................................................................................. Arthur H. Harris 295

Vegetation of Trans-Pecos Texas ......................................................................................................................... Michael Powell 299

History of Van Horn, Texas and Van Horn Wells ......................................................................................................................... Robin I. Hoffer 303

Land Use in the Basin and Range Topographic Province of Trans-Pecos Texas ................................................................. William I. Lloyd and Robert H. Schmidt, Jr. 305

Eagle Spring Station on the San Antonio-San Diego Mail Line .................................................................................. James R. Underwood, Jr. 311

The articles and road logs in this guidebook were prepared for presentation at the 31st annual field conference of the New Mexico Geological Society, held in the Trans-Pecos Region on November 6-8, 1980. No part of this publication may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, electronic, mechanical, photocopying, recording, or otherwise, without the prior written permission of the copyright owner.
PRESIDENT'S MESSAGE

On behalf of the New Mexico Geological Society, I welcome you to its thirty-first consecutive Fall Field Conference. As always, the finished product is due to the efforts of a number of hard-working people to whom we made an offer they couldn't refuse. Special thanks are due General Chairman William McAnulty and to Guidebook Editors Pat Dickerson, Jerry Hoffer and Jon Callender. In fact, "Mac" and Jerry should take two bows, since they also doubled as road-loggers, along with John Hills, Joe Muzzy, Bruce Pearson, Bill Strain and Frank Daugherty. Other indispensables were Registration Chairman Bill Strain, Caravan Chairman Randy Keller, and illustrator Paul Kmiec.

It seems to be traditional to say here that you are wished a blend of geology and good times at the field conference: the geology is surely here, and I expect the good times to materialize as well. If the mixture turns you on, I urge you to contact any member of the Executive Committee and volunteer to help us produce next year's masterpiece, scheduled for the West Slope of Colorado.

Again, welcome, and happy rock-pecking.

John E. Cunningham
President

EDITORS' MESSAGE

Editors harbor covert thoughts of producing a book under utopian conditions: responsible and congenial authors who work within the stated deadlines; papers of substance written with the cognizance that somewhere out there is a reader who may want to glean something from the publication; a printer with the fiscal conscience of Silas Marner, the aesthetic sensitivity of Michelangelo and the mechanical aptitude of Leonardo da Vinci.

We approached those utopian conditions with this volume. Authors submitted manuscripts in timely fashion; almost all were well written—an especially low SP-SE quotient (Silk-Purse-from-Sow's-Ear) for this guidebook; and the University of New Mexico Printing Plant did their traditional excellent job in producing the book. We appreciate all your efforts.

Our appreciation is extended, too, to M. A. Wiley, J. R. Underwood, Jr., D. F. Reaser, W. H. Hisa and D. H. Campbell for providing special illustrations; to Lauren Brown of the Woodson Research Center of Rice University library, for access to the Emory and Bartlett boundary survey volumes; to Sandy Ladewig of the University of Texas at El Paso, for stenographic services; and to P. Kmiec of Gulf Research and Development Co., for drafting assistance.

DEDICATION

"People are always asking me what my title is, thinking, I guess, it ought to be something fancy. I'm just a geologist."

—PHILIP B. KING

J. Hoover Mackin, in presenting the Penrose Medal of the Geological Society of America to King in 1965, stated: "I have recently had the good experience of walking over the ground with [King's map] in hand. The geologic patterns are graceful because they correctly portray the structure, not only where the contacts are exposed—this is merely a matter of accuracy of location—but where they are concealed; they were drawn by a sensitive hand controlled by a sort of reverent understanding of the meaning of the lines. . . . The understanding that gives life to the map patterns starts with the mechanisms of origin and transportation of the sediments and the physical and biological environments of deposition, continues through the diagenetic changes that transform the sediments into layered rocks and the response of the heterogeneous sequence of strata to constantly changing stress fields at different depths in the crust during successive periods of regional deformation, and through the erosional processes that finally laid the contorted strata open to the sky. If the geology is to be expressed by the work, these physical, chemical, biologic, and geometric relations must be seen in historical perspective by one man, on the outcrop, as the lines are drawn. This is what I mean when I say that Phil King is a field geologist."

P. B. King the field geologist did not, as he himself is quick to point out, spring full-blown from Zeus' head; his course was influenced by several notable geologists who recognized the ability and enthusiasm of the young geologist. The rudiments of his field geological training, for example, were provided when King had not even declared a major in geology, by C. K. Wentworth during a University of Iowa field course at Baraboo, Wisconsin.

Without sponsorship of any academic or industrial entity, Phil and his brother Robert undertook a survey of Permian rocks in the Glass Mountains in the summer of 1925. Phil became an instructor in geology at the University of Texas the following fall; that year Charles Schuchert, who had retired from Yale, was a visiting professor there, and he had become interested in the marine Permian rocks of the Glass Mountains. Schuchert arranged for financial support for the Kings' next two field seasons there, purchased Robert King's fossil collections for Yale's Peabody Museum, and helped get both to Yale for their doctoral studies.

It was W. S. Adkins, of the Texas Bureau of Economic Geology, who imparted to Phil King an awareness of global stratigraphic stages and of the fossil zones upon which they are based; after discussion with Adkins, stratigraphy could no longer be a provincial discipline for him. N. H. Darton provided further lessons in the science, as well as the art, of field geology; Darton and the Kings, on a foray into the Franklin Mountains, were able to demonstrate that the Hueco Limestone was not just a thick sequence of Pennsylvanian limestones as it had been previously mapped, but comprised units of Devonian, Mississippian and Permian ages as well.

Harry G. Ferguson, Assistant Secretary of the Sixteenth International Geological Congress in the early Thirties, was responsible for the transformation of what had been a rather incidental hobby for King—the synthesis of the geology and tectonics of large regions—into part of his formal professional responsibilities. Ferguson asked King to prepare a general description of the structure of the United States for distribution at the 1933 Congress to be held in the United States. His interest in regional
geological integration continues: forty-four years later, King's most recent revision of The Evolution of North America was published.

William Morris Davis was a geographer who inspired him. Davis, whose principal contribution had been in what is now termed geomorphology, developed a system of “geography” by which any landform could be classified on the basis of structure, stage and process. Although somewhat oversimplified in light of present information, that system provided an approach to surface geologic interpretation, elements of which King continues to apply.

Almost as influential as Davis’ geomorphologic concepts, however, were what King describes as his "exquisite renderings of landforms, by pen or pencil, or even by chalk on the blackboard. When I had been at the University of Iowa I took as many courses in art as I took in geology and the other sciences, and on graduation I had even thought of becoming a professional artist. But this seemed to be a chancy undertaking, with no assurance that it would be much of a mealticket. My first opportunity for a paying job was in geology, and a geologist I became. Yet I regretted that I possessed an ability now gone to waste; Davis' own skill in landform drawing showed the means by which I could use this ability in my geologic work." We the readers of King's publications are the real beneficiaries of Davis’ inspiration; several exquisite renderings by King of Sierra Diablo and of the Guadalupe Mountains grace this guidebook.

Officially, Philip King retired from the U.S. Geological Survey in 1973 after more than fifty years of service; officially or not, he continues to contribute to the profession, evidenced by his paper in this guidebook. Some authors of papers in this volume have been directly influenced by King, as he was by Adkins, Schuchert, Darton and Davis. Others of us have tracked around as Mackin described, one of King's maps in hand, impressed with the perception of the author who considers himself "...just a geologist."

-P. W. Dickerson

**1980**

**FIELD CONFERENCE SCHEDULE**

**WEDNESDAY, November 5**

**REGISTRATION DAY**

Registration: Ramada Inn, Van Horn, Texas
Cocktail Party (cash bar)

**THURSDAY, November 6**

**FIRST DAY**

Board chartered buses in parking lot of Ramada Inn for tour of the Duval sulphur operation, southern Guadalupe Mountains and Delaware Mountains. *(Bring your own lunch.)*

Banquet, Van Horn High School Cafetorium.
Speaker: Dr. Peter Flawn, University of Texas, Austin

**FRIDAY, November 7**

**SECOND DAY**

Board chartered buses in parking lot of Ramada Inn for tour of talc deposits of Tumbledown Mountains, Hazel Mine, Precambrian sections, and Tertiary volcanic rocks of the southern Wylie Mountains. *(Bring your own lunch.)*

Bar-B-Q supper at the Van Horn Community Center.

**SATURDAY, November 8 7:30-8:00 a.m.**

**THIRD DAY**

Assembly of auto-caravan at intersection of 1-10 and U.S. 80, west edge of Van Horn. Today’s stops will include the Precambrian rocks of the Carrizo Mountains, the type locality of the Texas Lineament, the Pioneer-Apache talc plant, Tertiary volcanic rocks and fluorspar deposits in the Eagle Mountains, and igneous and sedimentary rocks of the Quitman Mountains. The field conference will end at approximately 4:00 p.m. at the Rest Stop on 1-10 at the north end of the northern Quitman Mountains. *(Bring your own lunch.)*
