## **Annual NMGS Fall Field Conference Guidebooks**

Every fall since 1950, the New Mexico Geological Society (NMGS) has held an annual [Fall Field Conference](#) that explores some region of New Mexico (or surrounding states). Always well attended, these conferences provide a guidebook to participants. Besides detailed road logs, the guidebooks contain many well written, edited, and peer-reviewed geoscience papers. These books have set the national standard for geologic guidebooks and are an essential geologic reference for anyone working in or around New Mexico.

## **Free Downloads**

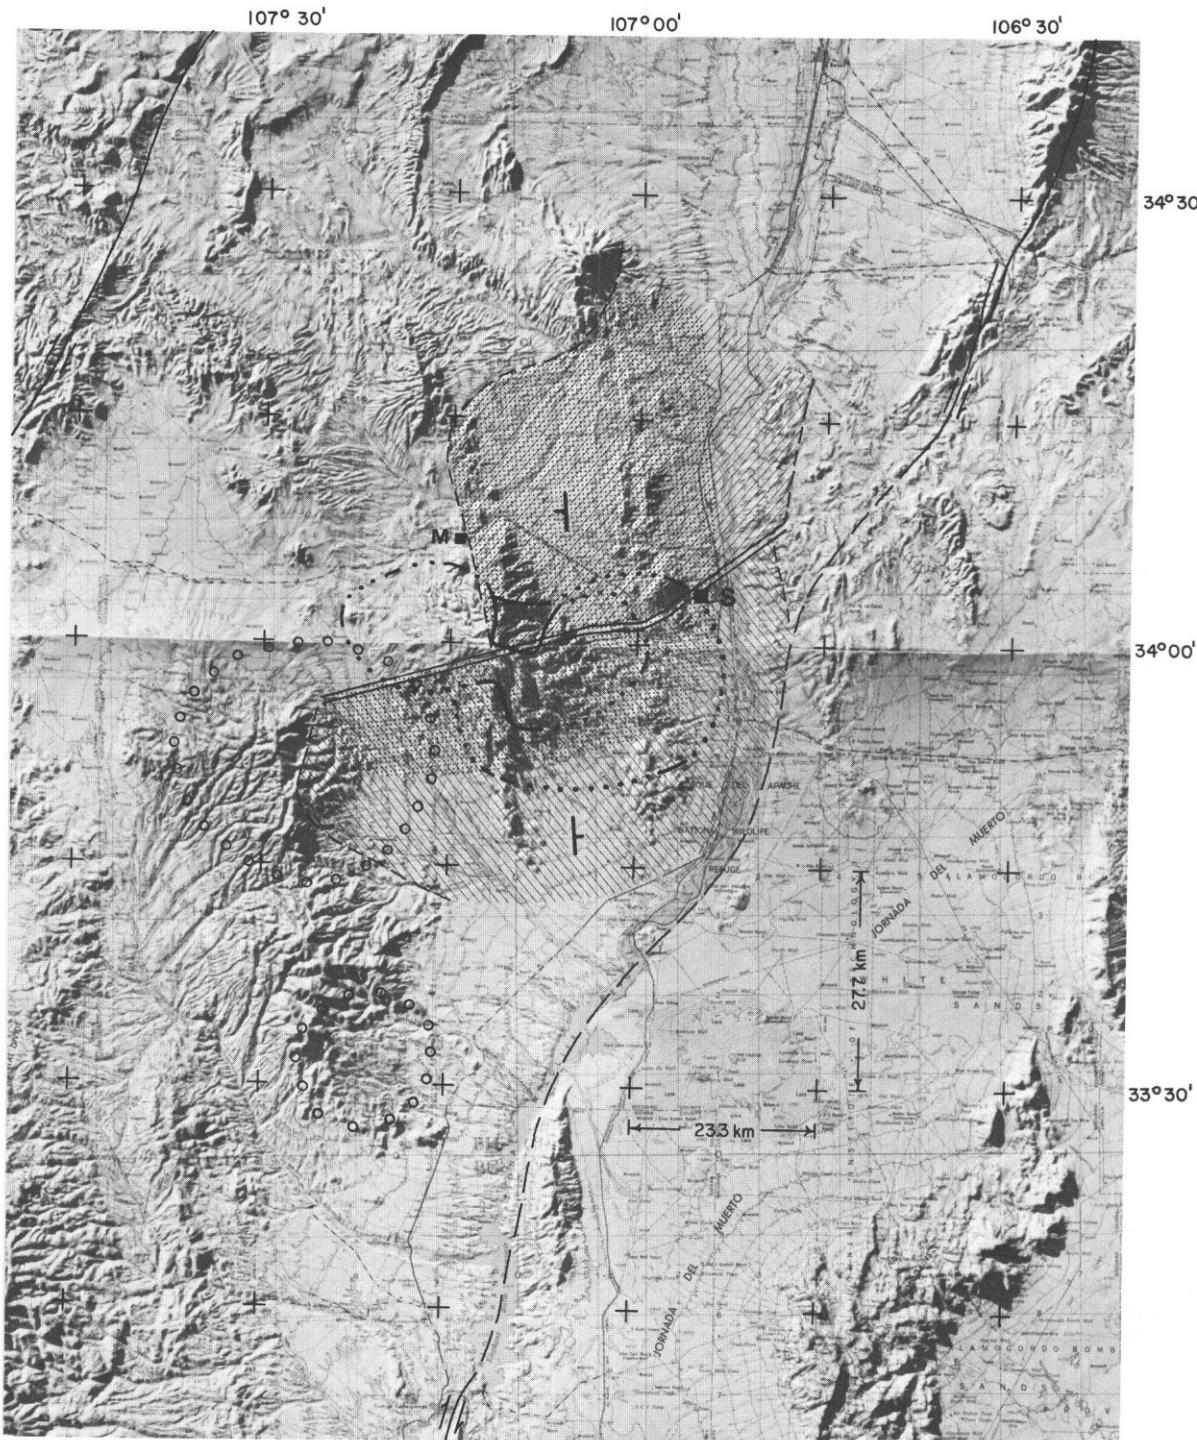

NMGS has decided to make peer-reviewed papers from our Fall Field Conference guidebooks available for free download. This is in keeping with our mission of promoting interest, research, and cooperation regarding geology in New Mexico. However, guidebook sales represent a significant proportion of our operating budget. Therefore, only *research papers* are available for download. *Road logs, mini-papers, and other selected content* are available only in print for recent guidebooks.

## **Copyright Information**

Publications of the New Mexico Geological Society, printed and electronic, are protected by the copyright laws of the United States. No material from the NMGS website, or printed and electronic publications, may be reprinted or redistributed without NMGS permission. Contact us for permission to reprint portions of any of our publications.

One printed copy of any materials from the NMGS website or our print and electronic publications may be made for individual use without our permission. Teachers and students may make unlimited copies for educational use. Any other use of these materials requires explicit permission.

## SELECTED TECTONIC ELEMENTS OF THE SOCORRO REGION

### C. E Chapin

Base is composite of Socorro and Tularosa 2-degree quadrangles (Army Map Service plastic relief maps). S = Socorro, M = Magdalena. Two domains of west-tilted versus east-tilted, domino-style fault blocks are shown by diagonally ruled patterns with large strike-and-dip symbols that show the directions of tilt. The two domains are separated by a transverse boundary (transverse shear zone) that acts as a null line across which the direction of tilting changes. The dotted pattern indicates a large area of potassium metasomatism of Cenozoic volcanic rocks and basin-fill sediments, interpreted as a fossil geothermal system (see D'Andrea-

Dinkelman and others, this guidebook). Solid lines and dots southwest of Socorro outline three overlapping cauldrons of Oligocene age delineated by detailed mapping (see Osburn and Chapin, this guidebook). Open circles outline two cauldrons proposed by Deal and Rhodes (1976) from reconnaissance work; the larger of these cauldrons is probably a composite of at least two cauldrons and needs considerable revision. Two major strike-slip fault zones are shown, the Red Lake fault zone on the west and the Hot Springs—Montosa fault zone on the east. Between these faults is a 100-km-wide zone of distributed strike-slip faulting along which the Colorado Plateau was translated approximately 100 km to the north-northeast, mainly during Eocene time (Chapin and Cather, 1981; Chapin, 1983).

#### KEY TO INDEX MAP

- .8.5 Flight elevation of constant-elevation surveys, in kilofeet above sea level.
- .4D Terrain clearance of draped surveys, in kilofeet.
- 1 Flight-line spacing, in miles.

CONTOUR INTERVAL = 25 GAMMAS

10 0 10 20 30  
KILOMETERS

INDEX MAP

Data from digital data set used to compile New Mexico State composite aeromagnetic map. Total magnetic intensity data from each of the 18 individual surveys (see index map) were reduced to a residual anomaly field by removing the Geomagnetic Reference Field (DGRF) appropriate for the time the survey was flown. Discontinuities at project boundaries were smoothed by computer, using bicubic-spline interpolation functions. Project boundaries will still be visible, however, as an inevitable consequence of variable flight elevation and other survey specifications. A more complete description of procedures used is given by Cordell, Lindrith, 1983, Composite aeromagnetic map of New Mexico, in Geothermal Resources of New Mexico: Scientific Map Series: National Oceanic and Atmospheric Administration, in press.
